This section is a complete Revision of Lubrication Specifications. Please Examine Carefully.

SECTION

1 R3

LUBRICATION SPECIFICATIONS

(8/73)

Lubricants used in Galion graders, rollers and cranes should be represented by the supplier as meeting the minimum quality requirements as listed in this section.

The Galion Manufacturing Company does not recommend any specific brand of lubricant. Brand names given are listed only as a guide to enable the user to more readily select the recommended lubricant or its equivalent.

TABLE A

TRANSMISSION & GEAR LUBRICANT SPECIFICATIONS*

SAE Specification: 90
Type: Straight Mineral Gear Lube

Straight mineral gear oils of the SAE viscosity recommended above which measure up to the quality standards of a reputable refiner of petroleum products are preferable and should meet these requirements.

Viscosity S.S.U. @ 210°F.-- 85-95
Flash point °F, minimum --- 350
Channel point °F ----- 0
Rust protection ----- Yes
Foam inhibited ----- Yes

TABLE B

TRANSMISSION & GEAR LUBRICANT SPECIFICATIONS*

SAE Specifications: 80
Type: Straight Mineral Gear Lube

Straight mineral gear oils of the SAE viscosity recommended above which measure up to the quality standards of a reputable refiner of petroleum products are preferable and should meet these requirements.

Viscosity S.S.U. @ 210°F -- 55.65
Flash point °F, minimum --- 325
Channel point °F ----- 30
Rust protection ----- Yes
Foam inhibited ----- Yes

TABLE C

TRANSMISSION & GEAR LUBRICANT SPECIFICATIONS*

SAE Specification: 140
Type: Straight Mineral Gear Lube

Straight mineral gear oils of the SAE viscosity recommended above which measure up to the quality standards of a reputable refiner of petroleum products are preferable and should meet these requirements.

Viscosity S.S.U. @ 210°F -- 120-160
Flash point °F, minimum ----375
Channel point °F ----- 20
Rust Protection ----- Yes
Foam inhibited ----- Yes

* DO NOT USE EXTREME PRESSURE LUBRICANTS--E.P. lubricants were compounded primarily for use in rear axles where unit gear tooth loads are very high and the rubbing action between the gear teeth is severe.

These oils contain added chemical compounds which, under certain conditions of operation, are designed to unite with the metal of the gear teeth and protect the rubbing surfaces. Extreme gear tooth loads have been designed "out" of Galion transmissions and the use of E.P. oils is unnecessary. In fact, most of these lubricants have certain undesirable characteristics for transmission use.

Sulphur and graphite are widely used as E.P. additives. Under certain conditions of operation, the sulphur in company with normal condensation of water will form corrosive sulfuric acid. Graphite, even in its purest form, must be classified as an abrasive material and will tend to increase wear when used in transmissions. In addition, the chemical instability of such lubricants may result in heavy soap and oxide deposits inside the unit, clogging the oil passages.

The object in draining the transmission oil periodically is to eliminate possible bearing surface abrasion and attendant wear. Minute particles of metal (the product of normal wear in service) are deposited in and circulate with the transmission oil. The oil changes chemically due to its repeated heating and cooling and also the terrific churning it undergoes in the presence of air. It is desirable to drain out this used oil at least every 1000 hours of service--more frequently when operating in a dusty or dirty environment. Do this only when the transmission is thoroughly warm.

After draining, flushing is desirable. Replace the drain plug and fill the transmission to the proper level with a light flushing oil. Drive the transmission for a short period at fast idle in such a manner that the gears in the transmission are rotating without load. This washes out the old oil clinging to the interior of the gear case, covers, and shifter rails.

Be sure to drain out all of the flushing oil before attempting to refill with new oil.

D.T.E. 13 -----	Mobil Oil Company
Super Hydraulic Oil 15	Continental Oil Co.
Magnus Oil 150 -----	Phillips Petroleum Co.

TABLE J

SAE 90 EXTREME PRESSURE (SCL) GEAR LUBRICANT

This specification covers a lubricant which may be used in gear cases to lubricate gears and pinions. CAUTION: DO NOT USE this lubricant at points not specifically recommended in this lubrication section. DO NOT mix with any other extreme pressure lubricant that is not SCL.

It shall be a well refined mineral oil, properly compounded with sulphur-chlorine-lead (SCL) type extreme pressure additives. It shall be free of fillers or abrasives such as fuller's earth, talc, graphite, cork, etc. It shall be stable, non-abrasive and non-corrosive to the materials used in the case gear mechanism whether or not in the presence of small percentages of water.

Physical and Chemical Properties

Viscosity S.U.S. @ 210°F -----	85.95
A.P.I. Gravity -----	14.4-15.9 degrees
Pour Point -----	-10°F max.
Flash Point -----	350°F min.
Fire Point -----	400°F min.
Channel Point -----	0°F min.
Sulphur (added) -----	1.20% min.
Sulphur (total) -----	3.00% min.
Chlorine -----	1.20% min.
Lead as Lead Oxide (P60) -----	2.00% min.
Moisture -----	.20% max.
Load carrying capacity (Timken Test -----	70 lbs. lever load min.
Abrasion Test (33 lbs., 6 hours)	20 milligrams loss, max.
SAE Test 750 RPM -----	350 pounds min.

TABLE S

OPEN GEAR LUBRICANT

The following products, or their equal, are recommended for lubricating roller open gear final drive.

OPEN GEAR LUBRICANT

COMPOUND	FLUID	SUPPLIER
Texaco Crater Compound #5	Texaco Crater Compound #5X Fluid, Texclad	Texaco, Inc.
Surett N1550	Surett Fluid 50	Humble Oil & Refining Co.
Sunep Compound 1250 Special	-----	Sun Oil Co.
Citgo Open Gear Compound #5	Citgo Open Gear Compound #5A	Cities Service Oil Co.
Mobiltac SS	Mobiltac E	Mobil Oil Co.
Cardium Compound EPC	Cardium EP Fluid G	Shell Oil Co.
Coglube No. 9	Spray-N-Stay	Continental Oil Co.

TABLE T

SPECIAL PURPOSE OPEN GEAR LUBRICANT

This specification covers a lubricant for use in certain gear drives and is not to be used for general chassis or anti-friction bearing lubrication.

It shall be made from well refined heavy base oils thickened with soda soap and other bodying agents and special extreme pressure additives. This lubricant is to be a fluid product and shall not contain lead soap or sulphur-chlorine additives..

It shall be represented by the supplier as meeting the following specifications.

- Penetration:
 - unworked ----- 340
 - worked 60 strokes ----- 330
 - worked 5000 strokes ----- 330
- Dropping Point 0°F ----- 370+
- Water resistance ----- excellent
- Rust protection ----- excellent
- Adhesiveness ----- excellent
- Timken OK load-lbs.----- 35+
- Corrosion ----- None
- Color ----- Black
- Saponified Content
 - Type ----- Soda-Lead
 - Percent ----- 15
- Base Oil
 - Viscosity SUS @ 210°F ----- 200

Most major oil companies have a product meeting these specifications. Some example brands are:

- Gearep G-1 ---- Standard Oil Co. (Ohio)
- Marfak HD EP 1 ----- Texaco, Inc.
- Cardium EPB ----- Shell Oil Co.
- Norva EP 375 or
- Pen-O-Led EP 350
- Humble Oil & Refining Co.
- Sun Gear Compound C or
- Sunaplex 781 ----- Sun Oil Co.
- Barium Outside Gear

**TABLE U
WORM GEAR COMPOUND**

This lubricant has long been available as a compound steam cylinder oil. It contains fatty materials such as tallow, lard or degreas, and a pour depressant.

If the ambient temperature is consistently below +32°F, drain and refill with SAE 80 straight mineral gear lube or SAE 30 Heavy Duty engine oil (MIL-L-2104C or API Engine Service CC).

TYPICAL PROPERTIES

Viscosity, S.U.S. @ 100°F ----3000-4000
 Viscosity, S.U.S. @ 210°F ----- 125-175
 Pour Point ----- 30°-35°F
 Saponification No. ----- 11-14
 Rust Test (ASTM-D-665A)----- Passed

Most major oil companies have a product meeting these specifications. Some examples are:

- Texaco 650T Cylinder Oil - Texaco, Inc.
- Marathon 598 Worm Gear Compound ----- Marathon Oil Co.
- Sohio Facto-Cyl 650
Standard Oil Co. (Ohio)
- Occident Cylinder Oil or
Sunoco Gear Oil 7-C ----- Sun Oil Co.
- Citgo Cylinder Oil 140-5
Cities Service Oil Co.
- Cylesstic TK 180
Humble Oil & Refining Co.
- Mobil Cylinder Oil 600-W.-Mobil Oil Co.
- Valvata J-78 ----- Shell Oil Co.
- Hector 3000 ---- Phillips Petroleum Co.

TABLE V

**HIGH TEMPERATURE LUBRICANT THROW
OUT BEARING GREASE**

This grease contains unusually high quality sodium soap and is recommended for all types of anti-friction bearings where extended lubrication intervals are necessary.

This grease exhibits a high dropping point to 500°F. and excellent oxidation resistance as shown by 200 + hours in the Bomb Oxidation Test. Mechanical stability, an important property of ball and roller bearing grease, is clearly shown by the small 5 point change in penetration of these greases from an unworked to a worked state.

This type grease is the choice of bearing manufacturers for use in sealed bearings and is especially effective in clutch throw-out ball bearing application requiring a low torque lubricant. Its body permits prompt channeling allowing the bearings to be free running yet perfectly lubricated with a thin film of grease.

TYPICAL PROPERTIES

Penetration
 unworked ----- 200
 worked 60 strokes ----- 205
 N.L.G.I. Consistency ----- 4
 Dropping Point °F ----- 500
 Color ----- Brown
 Soap Base ----- Sodium
 Base Oil
 Viscosity SUS @ 100°F. ----- 510
 Bomb oxidation @ 210°F
 Hours to 5 psi. Pressure Drop ----- 510

Some Examples Are:

- Fiberon AC----- Standard Oil Co. (Ohio)
- Andok C ----- Humble Oil & Refining Co.
- Thermatex EP2 ----- Texaco, Inc.
- Mobiltemp 1 ----- Mobil Oil Co.

**TABLE W
HYDRAULIC BRAKE FLUID**

At the time of assembly, Galion hydraulic brakes are filled with:

Wagner Lockheed Brake Fluid 21B

This brake fluid is suitable for use at all ambients to -60°F.

Use a fluid that meets the following specifications:

SAE	U.S. government specs.
70R-3	VV-H-910 (H58)

**Procedures for making changes of new Lubrication
Specifications on Galion Graders, Rollers and Cranes.**

The new lubrication specifications are located on Pages 1-4 of this section and are indicated by an asterisk (*). When the existing quantities of the previously utilized lubricants has depleted, it is recommended that the new specifications be used. When changing to the new specifications, the following procedure should be practiced:

It is imperative the new specification lubricants not be mixed with the old specifications in any manner.

1. After the unit has been operated sufficiently to bring the lubricant to normal operating temperature, remove drain plug and completely drain lubricant.
2. After draining, flushing is desirable. Clean and replace drain plug and clean fill plug area. Fill the unit to the correct level with a light flushing oil (See machine operator's manual for correct oil levels.) Operate the unit for a short period of time (5-10 minutes) under extremely light or no load condition. Drain ALL of the flushing oil from the unit while it is warm. Clean and replace drain plug.

3. To refill, clean the area around the fill plug and fill the unit to the correct level with the new specification lubricant. DO NOT OVERFILL as an excessive amount will serve no useful purpose.
4. Use same level checks and drain intervals outlined in the operator's manual for the new lubricants.

Note: If there is any doubt whether the unit has been filled with the old or new lubricant, the unit should be drained and flushed. Mixing of the lubricants could cause damage and cannot be tolerated.

The following serial numbers indicate factory fill with new specification:

TANDEM CASES

118C -----	11721 & Up
